THE DIFFERENCE:

DON'T SETTLE

WHEN IT COMES TO
ENDPOINT SECURITY

Endpoint security is one of the most critical components of a cybersecurity strategy. Unfortunately, it has never been more challenging to select the best solution for the job. With so many options on the market and features that sound identical, choosing a solution is anything but straightforward.

MAKE SURE YOUR SECURITY PROVIDER HAS FLEXIBLE ARCHITECTURE FOR THE DIGITAL WORLD

VS

OTHER VENDORS

TRUE CLOUD-NATIVE | Designed for the cloud-native, work from anywhere world.

NIMBLE | Lightweight agent that avoids the performance overhead historically associated with endpoint protection agents.

AGILE | We enable customers to deploy tens of thousands of agents at once, with no reboots necessary to install or change security settings.

NEXT-GEN | CrowdStrike's Security Cloud delivers enterprise security for what is most critical for the next digital wave – endpoints and cloud workloads, identity, and data.

STILL LEARNING | On-premises, legacy architecture design that is deployed to a cloud, with inadequate scaling for enterprise use.

OVERWEIGHT | Endpoint agent that has high memory consumption and high disk utilization to the tune of GBs on disk.

CLUNKY | Technology requires a reboot to install, needs subsequent reboots when changes are made, and needs custom builds to reduce their false positive problems.

LAST-GEN | Can't adequately perform basic current-gen endpoint capabilities because of legacy constraints.
